

Ryan Gogerty

Technology Analyst & JHU Master's Student

I'm Ryan Gogerty, a technology analyst at Barclays and an AI master's student at JHU with a passion for generative AI, entrepreneurship, and building technology that helps people learn and work more effectively. I enjoy developing AI-powered projects, exploring emerging technologies (both physical and virtual), and solving business problems.

I also have a passion for a variety of hobbies which range from playing and watching any variety of sports to cooking, gardening, going to the gym, and playing piano. I'm really looking forward to seeing what kind of problems AI will solve in the future and being a part of that any way I can.

Projects

Module 1: Personal Flask Website

A personal website built using Flask, a lightweight Python web framework. The site features a homepage with a biography and photo, a contact page with professional links, and a projects page showcasing coursework. The application is structured using Flask Blueprints for modular page routing, Jinja2 HTML templates for dynamic rendering, and custom CSS for layout and styling.

This project demonstrates core web development skills including server-side routing, template inheritance, static file management, and responsive CSS layout — all within a clean, reproducible Python environment.
